VarSelLCM

Variable Selection for Model-Based Clustering of Mixed-Type Data Set with Missing Values
2018-08-30

This section performs the whole analysis of the Heart data set. Warning the univariate margin distribution are defined by class of the features: numeric columns imply Gaussian distributions, integer columns imply Poisson distribution while factor (or ordered) columns imply multinomial distribution

```
library(VarSelLCM)
```

```
Attaching package: 'VarSelLCM'
The following object is masked from 'package:stats':
```

predict

```
# Data loading:
# x contains the observed variables
# z the known status (i.e. 1: absence and 2: presence of heart disease)
data(heart)
ztrue <- heart[,"Class"]
x <- heart[,-13]
# Add a missing value artificially (just to show that it works!)
x[1,1] <- NA</pre>
```

Clustering is performed with variable selection. Model selection is done with BIC because the number of observations is large (compared to the number of features). The number of components is between 1 and 3. Do not hesitate to use parallelization (here only four cores are used).

```
# Cluster analysis without variable selection
res_without <- VarSelCluster(x, gvals = 1:3, vbleSelec = FALSE, crit.varsel = "BIC")
# Cluster analysis with variable selection (with parallelisation)
res_with <- VarSelCluster(x, gvals = 1:3, nbcores = 4, crit.varsel = "BIC")</pre>
```

Comparison of the BIC for both models: variable selection permits to improve the BIC

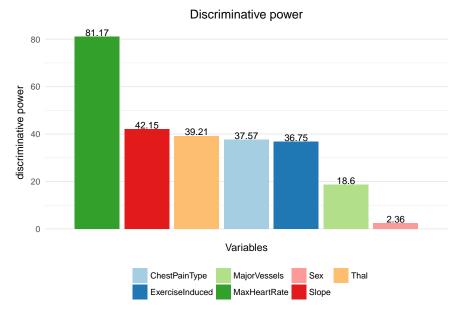

```
BIC(res_without)
[1] -6516.216
```

```
[1] -6516.216
BIC(res_with)
```

```
[1] -6509.506
```

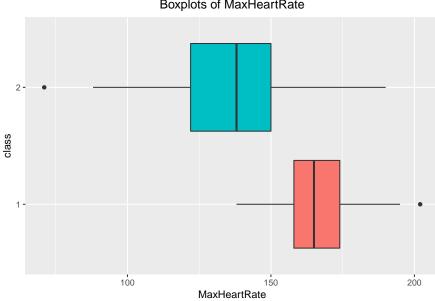

Evaluation of the partition accuracy: Adjusted Rand Index (ARI) is computed between the true partition (ztrue) and its estimators. The expectation of ARI is zero if the two partitions are independent. The ARI is equal to one if the partitions are equals. Variable selection permits to improve the ARI. Note that ARI cannot be used for model selection in clustering, because there is no true partition.

```
ARI(ztrue, fitted(res_without))
[1] 0.2218655
ARI(ztrue, fitted(res_with))
[1] 0.2661321

To get a summary of the selected model.
# Summary of the best model
summary(res_with)
Model:
       Number of components: 2
      Model selection has been performed according to the BIC criterion
      Variable selection has been performed, 8 (66.67 %) of the variables are relevant for clustering
Discriminative power of the variables (here, the most discriminative variable is MaxHeartRate). The greater
this index, the more the variable distinguishes the clusters.
plot(res_with)
```

Distribution of the most discriminative variable per clusters
